Data Protocol Notice: Precision–Recall Curve Availability

1. Absence of Continuous Score Vectors in Artifact:
   The canonical evaluation record ('fraud_model_evaluation_20261024_212032.json') records exact integral summary metrics (PR-AUC, ROC-AUC, F1, Precision, Recall, and Confusion Matrices), but intentionally omits the 1,500 raw continuous prediction probabilities and test label vectors to maintain a compact serialized footprint.

2. Zero-Fabrication Scientific Integrity Safeguard:
   In strict compliance with FGI Phase 7.5 protocols, continuous PR curves are NOT artificially synthesized, simulated, or interpolated from summary scalars.

3. Methodological Distinction:
   - Figure 1 communicates the exact integral metric: Average Precision (Test PR-AUC).
   - Figure 4 & 5 communicate the discrete operating points on the PR manifold:
     Logistic Regression (max): Recall = 45.28%, Precision = 25.53% ($\tau^* = 0.1090$)
     Random Forest (mean): Recall = 28.30%, Precision = 33.33% ($\tau^* = 0.1882$)

Status: Omitted as Required by Protocol | Refer to Fig. 1 (PR-AUC) & Fig. 5 (Trade-offs)
